Senior Software Engineer - Integrations Platform | Frontera

Cover letter

Hi Frontera team,

What caught my eye is that you put integrations inside ML & Data. The mapping decisions made at the boundary determine what the rest of the organization can actually know. I'd like to own that work at Frontera, where getting the handoff right can save a care team from reconciling the same information by hand.

For NuPrice, I built and ran a marketplace repricing product that took in Amazon marketplace and competitor data and applied rules merchants configured themselves. I also owned monitoring, account and subscription workflows, and support. Supporting the product meant understanding the incoming data, the configured pricing rule, and what the customer saw. I brought the same attention to explicit state and handoffs to Proofmark, where I worked on signing identity, document routing, audit history, and integrations via webhooks and embedded signing.

My experience is with marketplace and SaaS systems rather than EHRs. I'd start by walking through real partner records with Clinical Operations and ML/Data, so we can agree on what the data actually means before standardizing it. I'd use AI with approved inputs to surface candidate mappings and unusual cases, then make the mappings reviewable and testable rather than letting the model decide what gets accepted. I wouldn't put patient data into unapproved tooling.

Thanks,
Chad Koslovsky
